Your resume isnt getting rejected. It's swallowed.

It's not an ATS problem. It's a parser problem.

You print your resume as a PDF and upload it. You think it's fine. It isn't. Your resume has four jobs and the application system sees three.

The parser reads your document, drops a section it didn't expect or can't parse, and moves on silently. No error. No warning. Not even a "hey, we missed something." You find out months later when a recruiter asks why you have a gap.

This isn't an "ATS problem." ATS uses a parser to read resumes. It's NOT AI. And parsing documents is a 40-year-old problem that EDI solved in the 1980s.

Here's the model:

EDI	Resume
850 = Purchase Order	Resume
855 = Acknowledgment	Cover letter
810 = Invoice	Application
Segment	Section (Experience, Education)
Element	Field (Title, Company, Dates)
Parser	ATS

A resume is just a document with sections. Same structure as EDI. Different vocabulary. EDI has standards, specs, and acknowledgment messages. Resume parsing has none of it. The resume world is 40 years behind, and nobody told them.

What to do:

1. After you upload, open the parsed version. If you can't, upload a test and see what comes back.
2. Compare it to your original. Count the jobs, sections, dates.
3. If something's missing, fix the document — not the system.

The takeaway:

ATS isn't rejecting you. It's misreading you — and it never tells you. The fix isn't "optimize your resume." The fix is understanding that **every document a machine reads is a parsing problem**: resume, SDS, invoice, EDI. Same problem, different decade, different acronym.

Your resume content isn't the problem. Your resume isn't hard. Parsing is hard. And nobody's been honest with you about which one you're dealing with.
